0
 pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of MDMLP-1. such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                             Human; ss; probe; myosin-like protein-1; hGDMLP-1;

The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, ss; probe; myosin-like protein-1; hGDMLP-1;
hGDMLP-1 agonist hGDMLP antagonist; hGDMLP inhibitor; heart disorder;
skeletal muscle function.

                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                   The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids fully (S1), 95% deviation from (S1) which are conservative substitutions, and antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of HGDMLP-1, unch as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN61103
                                                                                                                                                                                                                                                                           ö
                          Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ss; probe; myosin-like protein-1; hGDMLP-1;

A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the
                                                                                                                                                                                                                                                         Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ss; probe; myosin-like protein-1; hGDMLP-1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                            The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 958 deviation from (S1) which are conservative substitutions, and 558 identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                        Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ss; probe; myosin-like protein-1; hGDMLP-1;

The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 958 deviation from (S1) which are conservative substitutions, and 558 identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63102
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; 88; probe; myosin-like protein-1; hGDMLP-1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the
                                                                                                                                                                                                                                                                                                                                                         Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to a novel polypeptide (I) comprising a sequence (SI) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a framen of at least 8 amino acids of (SI), 95% deviation from (SI) which are conservative substitutions and standard of the following of the invention acts as a agonist or an apparamental composition of the invention at susful for treating or pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
Human; ss; probe; myosin-like protein-l; hGDMLP-l;
hGDMLP-l agonist hGDMLP antagonist; hGDMLP inhibitor; heart disorder;
skeletal muscle function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Shannon ME;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                               ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and statementy to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle

The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 958 deviation from (S1) which are conservative substitutions, and 658 identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                    Human, ss; probe; myosin-like protein-1; hGDMLP-1;

The invention relates to a novel polypeptide (I) comprising a sequence (SI) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (SI), 95% deviation from (SI) which are conservative substitutions, and antagonist to (GI). A polypeptide of the invention acts as a gonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of hazart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an isolated human period (Drosophila) homologue 1, (PER1) polynuclectide (I) comprising a sequence which is a polymorphic variant for a reference sequence (ABL52077) for the PER1 gene or its fragment, or a polymorphic variant of a reference sequence (ABL52078) for a PER1 cDNA or its fragment. The present invention also elscribes methods for genetyphing and haplotyphing the PER1 gene of an individual. (I) is useful in studying the expression and function of PER1, and in expressing PER1 protein for use in screening for candidate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /*tag= a

The invention relates to single nucleotide polymorphisms in the human interleukin 8 receptor beta (IIBRB) gene. A method for haplotyping the interleukin 8 receptor beta (IIBRB) gene. A method for haplotyping the IIBRB gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the copies of the gene is defined by one of the IIBRB haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotypes. An association between a trait and a maplotype or haplotype pair of the IIBRB gene can be identified by a haplotype or haplotype pair of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair in a reference population, where a higher haplotype or frequency in the trait population indicates the trait is associated with the haplotype or haplotype pair. ILBRB and its corresponding DNA are used
          therapeutic purposes. A recombinant non-human organism transformed or transfected with (I) can be used for studying expression of the PER1 isogenes in vivo, for in vivo screening and testing of drugs targeted against PER1 protein, and for testing the efficacy of therapeutic agents and compounds for disorders associated with circadian rhythm regulation. The present sequence represents an allele specific oligonucleotide primer for human PER1, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; interleukin 8 receptor beta; IL8RB; ss; antiinflammatory; probe; haplotyping; haplotype pair; single nucleotide polymorphism; genotyping; gene therapy; drug screening; chronic obstructive pulmonary disease; inflammatory disease; sequencing primer; PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polymorphic variants comprising interleukin-8 receptor beta (ILBRB) isogene, useful in expressing ILBRB protein for use in screening for candidate drugs to treat diseases related to ILBRB activity, e.g.

ö
for studying the expression and function of ILBRB, for use in screening for candidate drugs to treat diseases related to ILBRB activity, such as chronic obstructive pulmonary disease and other inflammatory disorders. The sequences are also useful for studying the effect of variation on the biological activity of ILBRB as well as on the binding affinity of candidate drugs targeting ILBRB. Sequences AASS525-AASS5579 represent allele-specific oligonucleotide probes, sequencing primers and PCR primers used to detect ILBRB gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                         gene expression; downegulation; interleukin-5; IL-5; IL-5; intercellular adhesion molecule; rel A; tumour necrosis factor; intercellular adhesion molecule; rel A; tumour necrosis factor; TWF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial ischaemia; Rawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;

                                                                                                                                                                                                                                                                The present sequence represents a preferred target sequence for an enzymatic nucleic acid (1.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their conclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment.                                                                                                                                                                               Peptide nucleic acid probes for detection of ribosomal nucleic acid of mycobacteria - allow differentiation between species of tuberculosis complex and others and can penetrate cell membranes without pretreatment.
                                                                                                                                                                                                                                                                                 This is the nucleotide sequence of the peptide nucleic acid (PNA) probe used in the method of the invention, to detect ribosomal nucleic acid of mycobacteria. The probes are used, in situ or in vitro, for detection of the Mycobacterium tuberculosis complex (MTC), specifically M. tuberculosis, and especially in sputum samples, but also in other body fluids, biopsy specimens, foods, soil, alr and water. Particularly, they are used to diagnose, stage or monitor infection, or for identification of drug-resistant strains (which generally have mutations in rRNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1. .15

```
This is the nucleotide sequence of the peptide nucleic acid (PNA) probe used in the method of the invention, to detect ribosomal nucleic acid of the wocbacteria. The probes are used, in situ or in vitro, for detection of the Mycobacterium tuberculosis complex (MTC), specifically M. tuberculosis, and especially in sputum samples, but also in other body fulds, biopsy specimens, foods, soil, air and water. Particularly, they are used to diagnose, stage or monitor infection, or for identification of drug-resistant strains (which generally have mutations in rRNA)
                                                                                                                                                                                                                  0.8%; Score 13.4; DB 1; Length 15; 93.3%; Pred. No. 1.4e+02; tive 0; Mismatches 1; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide nucleic acid probes for detection of ribosomal nucleic acid of mycobacteria - allow differentiation between species of tuberculosis complex and others and can penetrate cell membranes without pretreatment.
                                                                      Peptide nucleic acid probes for detection of ribosomal nucleic acid of mycobacteria - allow differentiation between species of tuberculosis complex and others and can penetrate cell membranes without pretreatment.
                                                                                                                                                                                This is the nucleotide sequence of the peptide nucleic acid (PNA) probe used in the method of the invention, to detect ribosomal nucleic acid of mycobacteria. The probes are used, in situ or in vitro, for detection of the Mycobacterium tuberculosis complex (MTC), specifically M. tuberculosis, and especially in sputum samples, but also in other body fluids, biopsy specimens, foods, soil, air and water. Particularly, they are used to diagnose, stage or monitor infection, or for identification
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /*tag= a

differentially expressent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from CDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of isolated gene transcripts - useful for developing products for diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tag sequence; colorectal cancer; pancreatic cancer; colon cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                   AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-1ike Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an information and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders, she present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can seem invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, roblasis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scletoderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGB (serial analysis of gene expression) tag comprising a single stranded pixobe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABX31900-ABX32770 represent human colon and pancreatic cancer SAGE tags of the invention

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                            colon and
                                                                                                                                               The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK11900-ABK32770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme, HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon, interferon alpha, interferon beta; cytostatic, ss; interferon gamma, consensus interferon, hepatotropic, antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a RNA sequence of unknown function. Note: The present sequence is given in the sequence data but is not mentioned elsewhere in the specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication, cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; ss; interferon gamma; consensus interferon; hepatotropic; antiinflammatory.

characterisation tenaus to merunous and compositions on detection and characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (i) a folded target having a DNA sequence comprising at least 1 double stranded cegion, and at least 1 single stranded region; and (ii) at least 1 probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe complementary to at least a portion of the folded target; and (b) mixing the target complex. Also provided are methods for determination of structure formation in nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles of mammalian genes associated with disease and cancers, and the ammales, identification of the source of nucleic acids found in forensic samples, identification of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous
                                                                                                                                                                                                                                                        ö
other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a RNA sequence of unknown function. Note: The present sequence is given in the sequence data but is not mentioned elsewhere in the specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid detection; nucleic acid characterisation; hybridisation; infection; disease; cancer; forensic; paternity; multiplexing; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection and characterisation of nucleic acid sequences - by mixing folded target and one or more probes to form a probe/folded target complex and detecting and characterising the complexes.
                                                                                                                                                                                                                                                        Сарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to methods and compositions of detection and

analysis of both strands (e.g. the sense and antisense strands) and are ideal for high-level multiplexing. The products produced are amenable to qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support.) The methods are powerful in that they allow for analysis of longer tragments of mucleic acid than current methodologies. The present sequence represents the sequence no:68 in the specification for which no information is provided

Detection and characterisation of nucleic acid sequences - by mixing a folded target and one or more probes to form a probe/folded target complex and detecting and characterising the complexes.

Disclosure; Page 180; 279pp; English

characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (i) a folded target having a DNA sequence comprises: (a) providing: (i) a region and a least 1 single stranded region; and (ii) at least 1 double stranded region and at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe //folded target complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences to an infection, the presence of variants or alleles of mammalian genes associated with disease and cancers, and the identification of the source of nucleic acids found in forensic samples, The invention relates to methods and compositions of detection and

Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify Disclosure; Col 15-16; 168pp; English. bacteria.

The present sequence represents a polynuclectide that is able to form a triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex catability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test sequences to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in the presence of the DNA test sequence. Triplex formation of the part of the test sequence. Triplex formation of sequences, particularly for identification of bacteria (by detecting sequences) and user of the DNA test sequence. The method is used to detect DNA sequences for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus 쁌.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing accondancy structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying oligonucleotides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under
                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid accessible hybridisation site; detection, hybridisation, characterisation; identification; nucleic acid structure; diagnosis; PCR primer; probe; ss.

                                                                                                                                                                                                                                                 The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention
Identifying oligonucleotides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under amplification conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                 The invention describes a method of analysing nucleic acids comprising providing a target nucleic acid, e.g. hepatitis C virus nucleic acid having non-contiguous single-stranded regions (NCSR) separated by an intervening region, a bridging oligonucleotide capable of binding to the first and second NCSR; a second oligonucleotide binding to a portion of cleavage structure. The method is useful for analysing nucleic acids, e.g. hepatitis C virus nucleic acid useful for clinical diagnostic purposes and detection and identification of pathogenic microorganisms such as hepatitis C virus. This sequence represents an oligonucleotide associated with the nucleic acid analysis method of the invention.
                                                                                                                                                                                                                                                                                               aB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of analysing nucleic acids comprising providing a target nucleic acid, e.g. hepatitis C virus nucleic acid having non-contiguous single-stranded regions (NCSR) separated by an intervening region, a bridging oligonucleotide capable of binding to the first and second NCSR; a second oligonucleotide binding to a portion of cleavage structure. The method oligonucleotide binding to a portion of cleavage structure. The method is useful for analysing nucleic acids, e.g. hepatitis C virus nucleic acid useful for clinical diagnostic purposes and detection and identification of pathogenic microcaganisms such as hepatitis C virus. This sequence represents an oligonucleotide associated with the nucleic acid analysis method of the invention.
                                                                                                                                                                                                                                                           Analyzing nucleic acids, comprises mixing target nucleic acid such as hepatitis C virus nucleic acid, bridging oligonucleotide, second oligonucleotide and cleavage agent to form cleavage structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                              The invention relates to a novel recombinant DNA (I) encoding a recombinant chimeric protein (II). The protein consists of at least two nucleotide fragments, each encoding an epitopic region of at least one sequence encoding a linker, and at least one sequence encoding a linker, and at least one sequence encoding a linker, and at least one in vitro diagnosis, especially of virus-related diseases, specifically HIV-1 or -2 infections. The protein is easy to purify and synthesise, and has strong immunoreactivity with sera from virus-infected subjects. The protein is equence encodes a linker of the recombinant chimeric peptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying nucleic acid sample source, useful for identifying bacterial strains involved in nosocomial infections, comprises treating the nucleic acid sample with components comprising a nicking agent under nicking conditions.
                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                             g
```

The invention relates to a method of treating a nucleic acid sample with components under nicking conditions, where the components comprise a

```
nucleic acid sample to thus produce a family of initiating oncleoride fragments, and une consultating one or more members of the canily of initiating on oligonucleoride fragments and subjecting one or more members of the canily of initiating only and subjecting one or more members of the process to thus provide results. The method is useful for caracterization assay panel of diagnostic oligonucleorides that can identify any organism or individual. The method is useful for characterizing other DNA molecules e.g., cDNA, and for characterizing other DNA molecules e.g., cDNA, and for characterizing other DNA molecules e.g., cDNA, and for characterizing other DNA capacism of a nucleic acid sample e.g., bacterium, fungus, virus, plant, non-human animal or human. The method is particularly useful for rapidly fingerprinting DNA to identifying prokaryotic and eukaryotic species, subspecies, and especially strains or individuals of the subspecies.

C in e.g., nosocomial infections. Furthermore, the method is useful for diagnosing bacterial disease in plants and humans, monitoring for bacterial contemination, monitoring manufacturing processes for bacterial contemination, monitoring manufacturing processes for bacterial contemination, monitoring manufacturing bacterial contemination, monitoring manufacturing bacterial contemination microbiological assays, tracing bacterial contemination and/or coutening undired monitoring particultural sites contemination and recombinant molecules. This sequence corresponds to nucleic acid used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to a method of treating a nucleic acid sample with components under nicking conditions, where the components comprise a nicking agent, and the conditions cause the nicking agent to nick the nucleic acid sample to thus produce a family of initiating only oligonucleotide fragments to a characterization process to thus provide results. The method is useful for creating an assay panel of diagnostic oligonucleotides that can identify any organism or individual. The method is useful for characterization patterns. The method, kit or composition is useful for identifying the source organism of a nucleic acid sample e.g., bacterium, fungus, virus, plant, non-human animal or human. The method is particularly useful for rapidly fingerprinting DNA to identifying prokaryotic and eukaryotic species, subspecies, and especially strains of individuals of the subspecies. It is especially useful for identifying different bacterial strains involved in e.g., nosocomial infections. Furthermore, the method is useful for human and disease in plants and humans, monitoring for horganism contents and humans, monitoring for human contents and humans, monitoring the contents and humans, monitoring the contents and humans, monitoring the contents and humans. bacterial content and legace in plants and instance in content and legace in the environment, monitoring food for bacterial contamination, monitoring manufacturing processes for bacterial contamination, monitoring quality ssurance/quality control of laboratory tests involving microbiological assays, tracing bacterial contamination and/or outbreaks of bacterial infections, genome mapping, monitoring bioremediation sites, and for monitoring agricultural sites for test crops, bacteria and recombinant molecules. This sequence corresponds to nucleic acid used in the method of the invention.

Identifying nucleic acid sample source, useful for identifying bacterial strains involved in nosocomial infections, comprises treating the nucleic acid sample with components comprising a nicking agent under nicking conditions.

```
The invention relates to a method of treating a nucleic acid sample with components under nicking conditions, where the components comprise a components under nicking conditions cause the nicking agent to nick the conditions cause the nicking agent to nick the nucleic acid sample to thus produce a family of initiating of the conditions cause the nicking agent to nick the nucleic acid sample to thus produce a family of initiating olygonucleotide fragments to a characterization composition olygonucleotide that can identify any organism or individual. The method is useful for characterizing other DNA correctly, the method is useful for characterizing other DNA correctly with or composition is useful for identifying the source organism of a nucleic acid sample e.g., bacterium, fungus, virus, plant, conn-human animal or human. The method is particularly useful for rapidly fingerprinting DNA to identifying prokaryotic and eukaryotic species. It is especially useful for identifying officerent bacterial strains involved in e.g., nosocomial infections. Furthermore, the method is useful for diagnosing bacterial infections. Furthermore, the method is useful for diagnosing bacterial contamination, monitoring quality assurance/quality control of aborterial contamination, monitoring quality assurance/quality control of aborterial contamination, monitoring manufacturing processes for contamination and/or outbreaks of bacterial infections, geneme mapping, contamination and/or outbreaks of bacterial infections, geneme mapping, contamination and/or outbreaks of bacterial infections, for a contamination will molecules. This sequence corresponds to an olicomiclerial in the method is useful for corresponds to an olicomiclerial and recombinant molecules. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       corresponds to an oligonuclectide used in the method of the invention to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 16 BP; 4 A; 1 C; 4 G; 7 T; 0 U; 0 Other;

OTHER

New locked nucleic acid containing oligomeric compound capable of modulating survivin expression, useful for treating cancer such as breast carcinoma, lung carcinoma, etc.

Ξ

Westergaard M, Wissenbach

Petersen KD,

Claim 1; SEQ ID NO 8; 122pp; English.

The invention relates to an oligomeric compound (I) capable of modulating survivin expression, having 8-50 nucleotides and/or nucleotide analogues, where the compound comprises a subsequence of at least 8 nucleotides or nucleotide analogues, where the subsequence is located within a sequence chosen from one of 143 sequences given in the specification. (I) is useful as a caused by abnormal angiogensis, by administering (I) containing one or more LMA units that are targeted to survivin. (I) is useful as a cancer, in combination with chemcherapeutic agent such as busulfan (myteran), carboplatin (paraplatin), Taxol, doxorubicin (adriamycin), cert. (I) or a conjugate (II) containing (I) is useful as busulfan (myteran), carboplatin (paraplatin), Taxol, doxorubicin (adriamycin), cert. (I) or a conjugate (II) containing (I) is useful in the preparation of a medicament for the treatment of atherosclerosis, psoriasis, diabetic retinopathy, rheumatoxid arthritis, asthma, warts and allergic dermatitis. (I) (II) or a pharmaceutical (III) containing (I) is useful in the preparation of solid tumour, sarcoma, glloma or carcinoma chosen from malignant melanoma, bancer, renal cell carcinoma, bladder carcinoma, non-small cell lung carcinoma, ovarian carcinoma, carcinoma, pancreatic carcinoma, ovarian and carcinoma and carcinoma, amelanoma, and desmoplastic chordrosarcoma and carcinoid tumoures. The malignant melanoma is chosen from superficial pladeder cancer, stomach carcinoma carcinoma, acral melanoma, and desmoplastic chordrosarcoma and carcinoid tumoures. The malignant melanoma is chosen from suberficial special melanoma, and desmoplastic chordrosarcoma malignant fibrous histiocytoma, fibrosarcoma and desmoplastic chordrosarcoma malignant fibrous histiocytoma, fibrosarcoma and desmoplastic melanoma, acral melanoma and carcinodic processed to chemotherapeutic agent such survivin gene
